

## COLLECTING HEADS

Collecting heads are used to feed water from one or more standpipe supplies to the pump inlet of a fire tender. The outlet may be of any size to suit the pump inlet connection but the standard outlet connections are 3", 4" and 5 ½" female round thread to BS 336. Collecting heads with inline or angled inlets have a swivel outlet connection. Those with radial inlets have a fixed outlet connection.

Standard inlet connections are 2 ½" male instantaneous although other connections can be fitted as a special. The number and configuration of the inlets may vary as follows:-

<b>Configuration</b>	<b>Number of inlets</b>
In line	2, 3, 4, 5
Angled	2, 3
Radial	3, 4

Inlets are fitted with non return valves to prevent leakage when not in use or feed-back of water when main supply is cut off. Information required when ordering is, number of inlets, inlet configuration, inlet connection, polished or unpolished.

Please note that if blank caps are required these should be ordered separately.

1. Two-way inline Collecting Head in light alloy.
2. Two-way inline Collecting Head in light alloy/gunmetal.
3. Three-way inline Collecting Head in light alloy.
4. Two-way angled Collecting Head.
5. Three-way radial Collecting Head.
